

ABSTRACT

In international logistics that accompany information flows, errors or inconsistencies of data tend to occur partly
5 because of human interventions. To solve such problems, the present invention will be configured as follows:

The problems can be solved by a logistics control information system which comprises: a device (101) used for entering information, such as an item of cargoes to be exported,
10 required for customs procedures; a device (105) used for creating electronic document data required for customs procedures based on the information required for customs procedures and transmitting it to a customs via a network; and a device (106) which receives the examination result of
15 electronic document by the customs and transmit the received examination result to an information processing device of a party concerned which entered information required for customs procedures.
